Estimates of Demographic Characteristics of Virginia's Cities and Counties, 1977

Julia H. Martin, Michael A. Spar, and William J. Serow

This publication contains three tables: Table 1 presents race and age estimates for Virginia localities as of July 1, 1977; Table 2 presents revised July 1, 1976 age and race estimates; Table 3 presents household population and number of households for July 1, 1977.

The estimates of age and race composition were developed using the ratio-correlation (regression) method, one of the three methods used in generating the yearly population estimate series issued by the Tayloe Murphy Institute in conjunction with the Bureau of the Census. The estimates in this publication, however, are developed independently of the Bureau and, unlike the total population estimates, are not authorized by any agency as the basis for the distribution of state funds of any kind.

The household population estimates were generated by subtracting institutional population from the final July 1, 1977 estimates of the total population for Virginia localities. The estimated number of households was generated by dividing household population by estimated average household size, obtained by assuming that household size in each locality declined at the national average between 1970 and 1977.

In generating the estimates presented here, two methodological changes have been made since the 1975 publication. First, estimates of the population aged 65 and over have been taken directly from the set prepared by the National Clearinghouse on Aging, U.S. Department of Health, Education, and Welfare. Second, a substantially improved methodology has been used in generating the 1977 and revised 1976 age and race estimates. A detailed description of the method is available from the Tayloe Murphy Institute. Finally, it should be noted that total population, population by age and race, and household population are rounded to the nearest hundred, while the number of households is rounded to the nearest fifty.
